If you are interested about science earthquake prediction, please open here:

<http://earthquake.hit.bg>

You watch about 20 earthquake prediction in the Bulgarian newspapers, new theory about earthquakes an forecasts for more than 500 world locations for current Month.

The moon makes the tides in the oceans, raising the water. But the moon raise up the earth crust with 0,55m. At this moment the moon makes the earthquake...

It's an appealing hypothesis, but it fails a simple observaitonal test. If it were actually that simple, then a progression of earthquakes would follow some kind of wave pattern around the Earth. But that doesn't happen. So I think the moon is not the cause of earthquakes.
