See: http://ggweather.com/winter0405.htm . This is a quick page with a side−by−side comparison of NOAA's Winter (DJF) 2004−2005 Outlook for temperature and precipitation (issued in November) with the observed conditions for the same period. Nationwide the only strong signal that I see was accurately forecast was the precipitation deficit in the Pacific Northwest. To a lesser extent the forecast captured some of the warmth in the West but seemed to overstate it in the Pacific states which were only a little above normal.
