On Tue, 4 Sep 2007 08:53:52 +0200, "Szczepan Bialek" <sz.bialek@xxxxx> said the following:

Tree huggers are actually killing us.

Burning them releases the CO2 back into the atmosphere
faster than
decay of the dead tree would.

But the burning (open fire) radiate the heat into space and back SO2 and
fly
ash (both of them are the nutrient for plants) uniformly to soil..

see there!

So.. save the trees really means kill Earth!

To burn or to compost. More burning (open fire if possible) more trees (SO2
and fly ash are the nutrient for plants) and more heat send into space. They
who are against burning want to kill the Earth.
