If all humans on Earth went 'green' right this second it wouldn't stop or even slow down global warming. Global warming is simply a cycle that the Earth has experience about a dozen times BEFORE man even existed.

No such cycle has been found yet. Do you have anything resembling evidence?

I read the 0.08% from a scientific article once, perhaps less than 6 months ago. I read a lot of things and don't make bookmarks or photo copies of everything I read, sorry.

This was NOT some political speech, article or tv show either.

Why can't we agree ALL SCIENCE is science?

Seems people are taking the science that 'fits' climate change and throwing the rest away as some political conspiracy.

Re: 0.08% = Human contribution of CO2 in the atmosphere.

Re: 0.08% = Human contribution of CO2 in the atmosphere.

I will LOOK for the quote again if you'd be willing to read it?

The immediate question is what cycle are you talking about? You'll lose me fast with numbers.
