We are not GIS professionals; we are geologist mapping large oil & gas fields for a country in the eastern hemisphere.

What hardware, with the requisite software, should be used to gather locations with differential GPS? We understand that something like a Sportrack provides GPS with +/- 10 to 15 meters accuracy. If we correct the GPS reading with a reference receiver, we get +/- 1 or 2 meters, which is what we want.

There is a reference receiver near enough that we may use.
What hardware & software should we buy that is:

1. cheap,
2. can be used in a reasonable manner in the field,
3. provides the accuracy we need – 1 meter or less?

Please reply to the group or send email to lgscorp2000-gis@xxxxxxxxxxx
