Yes, except there are umpteen million GPS handsets out there which are not so equipped ..

That is not really true. In fact any map-able GPS will have more than sufficient hardware to match the sophistication of a USB dongle. There is CPU/RAM for crunching cryptographic algorithms, there is non volatile memory (also parts unaffected by hardware resets such as boot loader/firmware) for storage and there is either a USB or RS-232 interface for PC to GPS data exchange. My point is simply that a change of policy is not limited by the hardware we own.

.
