Hi there,

I am trying to use NIH Image 1.61, to overlay two images, but I am a bit stumped as to what the function is called.

A colleague of mine told me, that it was possible to use the application, to take one image, mark a certain point in the image, take another image, mark a similar point in that image, and then ask the application to calculate how to align the two images on top of each other, so you can see the differences in the two images.

Does this make any sense, or am I asking the application to do something it can't?

If you have any suggestions as to what application might be able to perform this function, please don't hesitate to answer.

Regards, Maria
