I guess excell won't open it at all because of its file-size limitation.
You'd better use a good plain text editor (textpad?) to see the guts.
If it is compressed or encrypted you'll have a hard job... you could try
changing the ".all" extension to .zip .arc .arj .rar .lzh because it could
be in a common compression format

Hi,
I got a CD with LiDAR data, but all files have an extension .all. I don't
know how to unzip them to a useful format. Please help.

This might be a file format for 1-2-3 spreadsheets.
Try opening a .all file in Excel and see if it
recognizes it.
