Which software could do that?:

create a shape, fill it with e.g a gradient.

put that shape over an image and then...

Apply a filter to the image, with _an intensity that is proportional to the gradient in the shape_.

That would be especially useful to blur special regions of an image, put speed ripples or change quite a lot of things that should not apply to the whole image or to the whole shape.

Which software could do that?:

Oh, BTW, clearly you can do that in Photoshop in a few passes...using the alpha channel for instance.

Best,
E.
