I am working on a image processing library. It would have many features for image adjustments i.e. tints, color temperature, saturation, fill/shadow light adjustments. But being a programmer, I don't know much about this stuff. I have been able to implement methods for basic color adjustments (brightness, contrast, channel adjustments etc) but not the ones I mentioned earlier.

I wanna add features like the ones in Adobe Lightroom and Apple Aperture, but can't find algorithms for certain effects, does anyone know of a good book/website that talks about that stuff or better off be willing to help me directly?

Thanks!

Why not contributing to an existing image processing library instead of rewritting lot of such stuffs ?

There are plenty of open source libraries that would be happy to get interesting contributions.

Plus, I'm not sure that it would be very easy to code advanced image processing techniques is you have only few knowledges on image processing. I guess working from a solid basis should be the easiest way to learn, then contribute to this field.
