I used tin for e-mail for a while, but I don't think I ever tried e-mail with it. I used rn for that, back in the days when so little news had JIS in it that it didn't cost much of my life to copy anything that looked interesting to RAM and convert it to Japanese.

The only real difference (aside from Japanese being Japanese without conversion) I see between my Mozilla news reader and rn is that I can see a section of the header list and a post at the same time, rather than having to switch from one to the other.

Now I'm curious to see how tin works...
