Incidentally Bart might like to notice the "][j-°kg,BŠ~Y^
m " (with the question mark) in the top page.

I'd kind of like to. My attempt to download resulted in a large number of empty pdf pages. I'll try a different reader if I can. Not that I can spare the time today. (But I'm really curious about how things I look at in a PDF file can be scored by anyone else.)

Two other pdf readers gave better results. Evince showed 10 fully-written little pages in the left-hand pane. Unfortunately they were too small to read, and the full pages were blank except for the elaborate headings.

KPDF got empty little, and empty big, pages. But still it and evince did a better job than the kghostview I tried first in that I got three kanji from both in the body of page 4, Zë and what looks like ;. That beats what the "default" displayer gv gives me.*
