The headers of Cindy's last previous post that I've received in this thread, Message-ID: <1165715409.814993.191350@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>, looks like it was injected into Google via Road Runner; I wonder if that's got anything to do with the price of fish.

Absolutely sod all I would think.

That post is set for UTF-8 and Base 64.

I tried a few test posts from Google groups and found

1. No way to change the preferences for encoding.
2. The page where you enter the text is UTF-8 by default. You can change from UTF-8 to view the page in something else but the headers remain UTF-8 even though the contents of the post are in the encoding you change to.
3. In any case if there's Japanese text in the post it turns out as Base64.

Unless there's some hidden trick for (1) that I missed it looks like Google Groups users just have to cross their fingers and hope that newsservers will be generous with accepting Base64 encoded posts.

Did your tests show up on a news server other than Google? Mine showed up on all three that I have access to. Thus, the base64 did not impede propagation.
