That document was labelled as Salomon proprietary on each page.

The FBI got search warrants and went into Jefferies and took control of a couple systems, and went home with the Ex–Salomon person and searched there and took his computer systems. [The case is still pending @6/97]

The code is simple. It's choosing the keyword filtration sequence that's tricky. I figured out how to determine it in an almost systemic way. Oddly enough, I needed no keywords for specifically seeking out source code.

So, keyword monitoring is highly effective, I could even cover three feeds, and, sigh, I should mention that it took well less than 5000 lines of programming source code for me to implement it.

And I generated two FBI cases.
