hi all,

default logic is a prominent example of a nonmonotonic logic. a default theory is usually a pair  $(W, D)$  where  $W$  is a set of formulae and  $D$  a set of default rules. in most systems, the 'new information' that's being learned that leads to the nonmonotonicity of the system is always formulae added to or retracted from  $W$ . does anyone know of studies of variants of this logic where  $D$  is changed? that is where one can retract and add new default rules?

thanks. -per
