I am not very good at estimating a distance length without measuring it with a meter stick. There are some that can look at a piece of board or pipe and tell instantly whether it is 4" or 6". I am not.

I made a mistake in that the plastic pipe I am using is 4" diameter. When I make a mistake like this I go back and change it in my other posts with the symbol of (sic) after making the change. So it would look like this in my old post—

4" (sic). I used to use brackets instead of paranthesis but found out that some computer protocol looks at brackets as a command rather than plain text and so have gone from brackets to paranthesis. I used to have trouble with the reverse symbol of > in that the protocol on websites does not treat that symbol as plain text.
