Thanks, John. One can show this property of field extensions is transitive.

That is, define a field extension  $K/F$  to be Palmieri-flat (or  $P$ -flat) iff:

For any  $F$ -algebra  $A$ ,  $K \otimes_F A$  is isomorphic as a  $K$ -algebra to  $K[X]$  implies  $A$  is isomorphic as an  $F$ -algebra to  $F[X]$ .

Then  $K/H$  is  $P$ -flat and  $H/F$  is  $P$ -flat imply that  $K/F$  is  $P$ -flat.

Proof: A calculation based on  $K \otimes_H (H \otimes_F A)$  being isomorphic as a  $K$ -algebra to  $K \otimes_F A$  gives  $H \otimes_F A$  isomorphic

Re: polynomial algebra question

to  $H[X]$  by  $P$ -flatness of  $K/H$ , and hence that  $A$  isomorphic to  $F[X]$  by  $P$ -flatness of  $H/F$ .

If  $A$  is algebraic over  $F$ , then  $K \otimes_F A$  is algebraic over  $K$ . So a field extension  $K/F$  which is not  $P$ -flat must involve a counterexample  $A$  that is not algebraic over  $F$ .

No simple extension  $A = F[a]$  can be a counterexample ( $a$  must either be transcendental or algebraic wrt  $F$ ), and from the above argument we cannot have a counterexample from finite extensions either.

regards, chip
