Hi all,

My question is :are there any roulette winning systems out there that might work or make any sense at all?

I think most of them either claim to use the equal random distribution of numbers to their advantage or they claim to have a way to either bet or stop at the right time.

I have to admit the equal distribution theory sounds almost plausible. And if you would have 37 numbered tubes and after each spin insert a ball in the corresponding tube, they would fill up at about the same rate. Which would indicate the odds of them not filling up at the same rate are less likely and there might be a small advantage here.

And most betting and stopping systems use some kind of method to adjust you next bet based on previous results, which might also be a way to use this advantage.

However from a pure statistical point of view each spin has no connection with any previous spin(s) and with the house having an 1/37 advantage suggesting a winning system might exist sounds rather insane. Even if we consider a wheel without the zero and the house and player having equal chances.

Any thoughts on this?

John
