

How to derive this step in the Ito integral?

Source: <http://sci.tech-archive.net/Archive/sci.math/2005-09/msg03760.html>

In the derivation of the Ito integral, given W the Wiener process, a critical step is:

$$E[(w(i+1)-w(i))^4]=3(t(i+1)-t(i))^2$$

How does the above equation hold?

Thanks in advance.

VB
