It would be of help beyond measure if I found commentaries, especially full solutions for many exercises, to at least some classic textbook in the basic subjects of analysis, topology, and algebra. Where do I get this? Surely there is such a thing for at least one classic book in each basic subject? It seems so at least for Jacobson's Algebra 1 but I have no access to this. I have several particular texts in hope, but I'm ready of course for admissible alternatives.

Thanks,
Dani
