How to prove that every solution of differential equation

$$(*) y' = ((y^2+1)/(x^4+1))^{1/3}$$

has two horizontal asymptotes?

I tried to apply the following:

LEMMA: Let $f_1(x,y)$ and $f_2(x,y)$ be continuous and Lipschitz for all (x,y) in G , where

$$G = \{(x,y): x \text{ in } (a, b), y \text{ in } (c, d)\}.$$

Suppose that $f_1(x,y) < f_2(x,y)$ in G .

Let $y_1(x), y_2(x)$ for x in (a_1, b_1) ($a_1 \geq a, b_1 \leq b$) are solution of differential equations:

$$y_1' = f_1(x, y_1) \text{ and } y_2' = f_2(x, y_2) \text{ respectively such that}$$

$$y_1(x_0) = y_2(x_0) = y_0$$

(of course (x_0, y_0) in G).

Then $y_1(x) \leq y_2(x)$ for all x in (x_0, b_1) (x_0 in (a_1, b_1)).

P r o o f. $y_1(x)$ and $y_2(x)$ are unique and continuously differentiable on (a_1, b_1)

so the function $h(x) = y_2'(x) - y_1'(x)$ is continuous on (a_1, b_1) and since

$$y_1(x_0) = y_2(x_0) \text{ it follows that } h(x_0) = y_2'(x_0) - y_1'(x_0) = f_2(x_0, y_0) - f_1(x_0, y_0) > 0.$$

By continuity of h we have that $h(x) > 0$ in some interval (x_0-r, x_0+r) , where

$r > 0, a_1 \leq x_0-r, x_0+r \leq b_1$. Hence $y_2(x) - y_1(x) = \int_{x_0}^x h(t) dt > 0$ for x in (x_0, x_0+r) . ($\int_{x_0}^x h(t) dt$ means definite integral of function $h(\dots)$).

Now suppose that there exists p in (x_0, b_1) such that $y_1(p) > y_2(p)$.

Let $p_0 = \inf\{p \text{ in } (x_0, b_1): y_1(p) > y_2(p)\}$.

We have $p_0 \geq x_0+r$ and also $y_1(x) < y_2(x)$ for x in (x_0, p_0) so

we must have $y_1(p_0) = y_2(p_0) = y_{p_0}$ since y_1 and y_2 are continuous.

Every solution of diff.eq. $y' = ((y^2+1)/(x^4+1))^{1/3}$ has two hor. asymptotes? How to prove that? 1

Every solution of diff.eq. $y' = ((y^2+1)/(x^4+1))^{1/3}$ has two hor. asymptotes? How to prove that?

It follows that $h(p_0) = y_2'(p_0) - y_1'(p_0) = f_2(p_0, y_2(p_0)) - f_1(p_0, y_1(p_0))$

0.

By continuity of h we have that $h(x) > 0$ in some interval $(p_0 - r_1, p_0 + r_1)$, where $r_1 > 0$, $a_1 \leq p_0 - r_1$, $p_0 + r_1 \leq b_1$. Thus we have that $h(x) > 0$ for all x in $(p_0, p_0 + r_1)$.

Hence $y_2(x) - y_1(x) = \int_{p_0}^x h(t) dt > 0$ for x in $(p_0, p_0 + r_1)$ and this contradicts the definition of p_0 .

End of the proof.

Because $f_1(x, Y) = ((y^2+1)/(x^4+1))^{1/3} > 0$ for all (x, y) in \mathbb{R}^2 so every solution of the differential equation (*) is increasing. Hence it is enough to show that the solution is bounded above.

Suppose that $y_1(x)$ is a maximal solution of (*) defined for all x in $(-\infty, \infty)$ (I shall show this later).

If the solution $y_1(x) \leq 1$ for all x we are done.

Suppose $y_1(x) > 1$ for x in some interval (a, ∞) , $a > 0$.

Now let $f_1(x, Y) = ((y^2+1)/(x^4+1))^{1/3}$ and $f_2(x, Y) = (2y^2/(x^4+1))^{1/3}$. Let $y_2(x) = (-2^{1/3})x^{-1/3} + C$ where

C is constant such that $y_1(x_0) = y_2(x_0) = y_0$.

Consider $x_0 > x_1 > 0$.

We have $f_1(x, y) < f_2(x, y)$ for all $x > x_1 > 0$ and $y > 1$. By LEMMA we have that $y_1(x) \leq y_2(x)$ for $x \geq x_0$. Since $y_2(x)$ is bounded above for $x \geq x_1$ so is $y_1(x)$.

Similarly $y_1(x) < -1$ for x in some interval $(-\infty, a)$, $a < 0$.

Now why every maximal solution $y_1(x)$ of (*) is defined for all x in $(-\infty, \infty)$?

Because $y_1(x)$ is bounded and the curve $(x, y_1(x))$ must reach the boundary of the set \mathbb{R}^2 so x must reach $+\infty$ and $-\infty$.

Does anybody have some hint, some different (especially simpler) solution of the problem?

TIA

Jan

Every solution of diff.eq. $y' = ((y^2+1)/(x^4+1))^{1/3}$ has two hor. asymptotes? How to prove that? 2

Every solution of diff.eq. $y' = \frac{(y^2+1)}{(x^4+1)^{1/3}}$ has two hor. asymptotes? How to prove that?
