The book Mathematics for the Nonmathematician and Mathematics: It's content, methods, and meaning should greatly help him. I would expect that he should read a section many times.

It is important to note that logic is important and I think can be formally studied at age 10 or after.

What I would do is get a book like Arithmetic Refresher, run him through it, and make sure he has it all.

Then use a book on the SAT test.

Thrid use a book such as How to Prove It.

It also important to note that arithmetic and mathematics is not the same. Mathematics is two parts: solve equations, and prove theorems.

Have you considered homeschooling him?

.
