Kant has been shown wrong about the supposedly a priori truths of geometry.

That's not really clear. Kant said Euclidean 3D geometry was the kind we had in our heads, so to speak, and that's certainly arguable. He also said that didn't mean it must be true of things as they actually are, and in thinking that he seems to have been well ahead of his time.

Ok, what am I missing here? You seem to be in agreement with me.
