The problem I have here is that modern people calling themselves mathematicians definitely know how to play political games.

I've watched them played out over the years since I found the short proof of Fermat's Last Theorem.

If I didn't demonstrate that some of you have a complete contempt for mathematics and a contempt for the welfare of others, then it might have been possible for some of you to be convincing in continuing to lie about your real role and motivations in blocking the intellectual progress of civilization in the area of mathematics.

But that won't be a problem as the minutes stretch into hours and maybe even days, as the proof is out there now.

The mathematics is simple enough with a complete solution to a factorization given.

If mathematicians can't follow a simple proof, then how can they be mathematicians?

But if they follow a simple proof, which could mean that security systems can be broken into, and sit on their hands, like they did with my earlier research, then my point that they don't care about proof will be made, and people will also understand just how bad the situation truly is.

And then they'll know that yes, some of you could have realized that I found a short proof of Fermat's Last Theorem, and keep quiet about it, to help hide the fact.

And yes, you could know that ideal theory was bogus, and still teach it to vulnerable and trusting young minds because some of you are people who don't give a damn.

That removes the political arguments you might use.

The clock is ticking...

JSH: They wouldn't believe otherwise
