One of the sadder things about this whole saga is how often people lose in arguing with me—and just claim otherwise.

Then some other people claim they didn't lose, and the cycle continues.

So it's a group thing.

Kind of like a race where one runner leaves the others in the dust, but after the race is over, they just say he lost.

This has been going on for years.

So no matter what, from my prime counting programs to the partial difference equation within them, to my definition of mathematical proof, to my logical ideas, the math people just say it's nothing important.

So tonite I posted a simple algebra argument that blows away some crappy math ideas, but so?

I've done it before.

The real world is about failure—the failure of reason.

More people will die this year from the failure of reason than anything else, and even more will die the next year and the next, and you know what?

A lot of those people will die confident they were making the best decisions.

Re: They fail in reply to me all the time

Reality is that a lot of people can be confidently wrong, and lead each other, confidently, and wrongly, and face the consequences of those mistakes, and it not change the reality, that a lot of people can be confidently wrong and lead each other, confidently, and wrongly.

Proof for most people is just a word.

Your problem is that you think by resisting the idea to learn common mathematics that you can somehow force everyone else to go along with your ideas about math. It's like me trying to convert all the Chinese to learn English when I can't speak a word of it.

Why don't you first try to learn a bit of mathematics before you try to talk to mathematicians about math? Oh, I forgot... you're just a troll. A big fucking ugly one too.

I've asked the same question, but I think his position would be that math books are written by dirty lying mathematicians.

Dave
