So I went to the factoring problem.

And never solved it.

Maybe not, but what is your proof?

Or do you want people to trust you?

And don't say if I had it I'd use it, as why?

Why would I bother if I think the math world is corrupt?

What might I do instead?

If as I say mathematicians routinely lie about math, and I do come up with a viable factoring approach then it stands to reason that they would CONTINUE to lie, but other people might use the research anyway.

That is irrelevant, since you will never come up with a viable factoring approach faster than the known ones.

And you have a crystal ball?

Where is the mathematical analysis?

You're sounding no better than a fortuneteller, got anything else?

Re: JSH: Contradictory behavior, issue of math fraud

Re: JSH: Contradictory behavior, issue of math fraud

If my retirement dollars depend on the answer, what are you giving me so that I can feel safe?

But then again, I might simply be unable to come up with a viable approach to the factoring problem.

You *\*will\** be unable to come up with a viable approach to the factoring problem faster than the known ones.

And if I do, will you personally vouch for the money lost for those who lose their savings?

Are you ready to say here and now that you will give every dollar you own to make up as best you can for those who lose money, if you are wrong?

Archimedes said, give me a lever long enough and a solid place to stand and I can move the world.

That same Archimedes created a method of computing pi and he actually did compute pi with great accuracy. Why don't you follow his lead and actually find a faster way of factoring numbers, instead of just babbling about it.

How do you know that I'm not just setting the stage to do just that?

It is a long weekend you know, here in the US.

Do you want to stake your entire worth on the answer?

Put up everything you own against the question.

Promise to give every penny you have to those who lose money if you're wrong.

Or there is nothing here and I'm just a loudmouth on Usenet babbling nonsense,

Nice and accurate self-description, James!

Re: JSH: Contradictory behavior, issue of math fraud

Best regards,

Jose Carlos Santos

If so, then there is nothing to stop you from pledging every dime you own to those who lose money if somehow, someday you got it wrong.

James Harris
