Han de Bruijn <Han.deBruijn@xxxxxxxxxxxxxx> writes:

It appears that the confusion stems from mainstream mathematics failure to distinguish a childish model from any serious implementation, once again. Look, my Implementable Set Theory e.g. is covering all Database Applications on Earth, which is .. a billion dollar business!

Wow!

I could ask what "covering all Database Applications" is supposed to mean, but that would be presumptuous. After all, you're the guy with a billion dollar implementation of set theory! I got doodlyquat.

Billion dollars. Golly. Wonder when the residuals will start pouring in.
