If this means "triangles are similar" this is wrong,

And then the triangles are similar

However, your calculations are perfectly right. And the triangles are obviously similar (equal angles).

But :

.... and another one which thinks that sci.math is a "google group" ...
No, it is not ! it is a /usenet/ group that Google tries to usurp.
Google doesn't make any difference with superseded messages.

I discarded my first post as I realized I wrote that.
Any true news server doesn't show the superseded message but the new one instead...
And now all over the world there will be answers to a message that doesn't exist anymore (the superseded message).

I don't post against you, I just post against Google :
no correct handling of superseded
no correct handling of threads
no correct handling of signatures and quoting
allows for so much spam as the finding/following of a thread is nearly impossible
etc...
Only disadvantages versus a true news server.

Regards.
