[...] Anyway here is a simple formalism concerning the notion of /limit/ for sequences of sets: [...].

And that approach becomes even simpler if we are dealing with /monotone/ sequences of sets.

If  $(E_n)$  is an /increasing/ sequence of sets, i.e.  $E_n \subset E_{(n+1)}$  for all  $n \in \mathbb{N}$ , then the limit exists, and we have

$$\lim_{n \rightarrow \infty} E_n = \bigcup_n E_n.$$

If  $(E_n)$  is an /decreasing/ sequence of sets, i.e.  $E_{(n+1)} \subset E_n$  for all  $n \in \mathbb{N}$ , then the limit exists, and we have

$$\lim_{n \rightarrow \infty} E_n = \bigcap_n E_n.$$

So it's extremely easy to determine the limit of the sequence in this cases. (Just calculate the union or intersection of all  $E_n$  – that's all.)

Example:

Let's consider the sequence of sets  $(S_n)$  with

$$S_n := \{m \in \mathbb{N} : m < n\} \quad (n \in \mathbb{N}).$$

Then

$$\begin{aligned} S_0 &= \{\} \\ S_1 &= \{0\} \\ S_2 &= \{0,1\} \end{aligned}$$

$$S_3 = \{0,1,2\}$$

∴,

and, of course,  $S_n \subset S_{(n+1)}$  for for all  $n \in \mathbb{N}$ . With other words,  $(S_n)$  is an increasing sequence of sets.

Now it's easy to "see" (i.e. prove) that

$$\bigcup_n S_n = \mathbb{N} = \{0,1,2,\dots\}$$

Hence

$$\lim_n S_n = \mathbb{N}.$$

F.
