I was basically asking whether elements in a set need to
share something
in
common.

Other than membership in that set, no!

Then why would they be in a set in the first place?

Because its there! Edmund Hillary understood!

Can you provide me with an example of a set whose elements have nothing in
common with each other, other than the fact that they belong to the set?

I will not. I will let you worry about whether I can or not.
