You are quite correct; we cannot wait until the "correct research" is being done. In fact, in too many cases, the FDA waits too long, and it is acting under pressure. The probabilistic analysis needed cannot be done except approximately, but those indoctrinated in the classical statistical religion are unable to understand this. Giving me the information that something was significant at a certain level, or the p-value, gives me some information, but not the relevant information.

Here, we are given information about short term changes in small death rates from cardiovascular problems, but without considering all the relevant factors, and without adequate consideration of other problems. One thing always mishandled in medical studies is the question of those who drop out.

I have seen the highly quoted summary paper, and I am not convinced. I will accept that lowering cholesterol to quite low levels will decrease cardiac incidents for most

sci.med.cardiology: Re: "Statins caused my kidney failure"

people in the short run. The rest is unclear.
