If the procedure is successful and all the narrowed arteries are opened then you will feel better soon, especially if the disease is more severe you will feel better more quickly.

On the contrary, if the disease is too severe to be treated by angioplasty then you may need coronary artery bypass graft surgery; that is another story.

Angioplasty could be done via radial artery (around wrist) or femoral artery (around groin); if it is done via radial artery you can walk out the cath lab immediatly after the procedure, if is is done via femoral artery then you have to keep bed rest and leg straight for at least 4-6 hours.
