truly necessary to transfer a large amount of code, such as Informix working to convert a large Sybase app, then take the time to write a shell script that (using say 'sed') scrambles the names of environment variables, and be sure to hand-ruin any proprietary algorithms.

Why is transfer of Salomon proprietary source to a vendor's site the last step to try? Because Salomon loses control over the code. In the Informix /Sybase case, the vendor Informix requested (and received) another copy of the code "because I lost the previous copy".

Two emails between the pair are enclosed.

```

Hi Dennis,

The last patch didn't help, here's some other code that will also trigger the bug.

This code doesn't compile for other reasons but we need to get the Rougeview issue resolved.

Could you ask xxxx to look this over?

Thanks,

sara
