For economic reasons , I'm trying to get away with some version / combination of 2 implants to stabilize a full upper denture , palate etc – then have two more put in later. Two implants to stabilize the full bottom denture. Was told that two would definitely help stabilize,, just wouldn't last as long as four.

Would like the dentures to be " premium, " the more lifelike , pricier grade; the implants immediate load .

Have only 2 or 3 front top teeth ( maybe posts ) holding in one unit caps, two molars; 3 bottom : 2 molar, 1 bicuspid-type.

Heard that I might only need one temporary denture, that one can be relined – can't remember which : top or bottom ?

All for under \$10,000 . 2 full dentures \$800.00 each, 1 temp, 4 implants \$ 1,600.00 each ? am in the Northeast USA, New York Westchester County area.

How would the new MINI implants help in this case ?

Any thoughts ?
