Hi

I was just wonder whether I ought to be concerned over my recent PSA test that showed a rise from 2.1 to 2.7 over 12 month period.

I am 49 years old and my brother had prostate cancer last years (at 57). My GP want to repeat the PSA test in 3 months to get another comparison.

I basically feel okay, infact other blood tests for LFT and Cholesterol were better than a year ago.

Best wishes

Pete
