J,
Thank you for the information. Peter may also appreciate it, since he had asked me for that type of info. He might want the link to it.

Peter,
Please stop taking personal issue with what I say. I promise I'm not out to insult you, only defend my point of view from your viewpoint.

Artemisinin is not simply an alternative herb. Not if the Gates Foundation is applying it to many patients for malaria.

Malaria is not cancer, so quit trying to squeeze more out of this fact than its worth. Or did you see anyone here saying it DIDN'T work as an antimalarial?.

Interestingly enough, if you have a medical background you'll appreciate that the scientists and doctors that have commented on the Artemisinin studies say that it kills cancer in the same way it kills the malaria parasite. It apparently is drawn to the iron-rich cancer (or malaria host) cells and kills the cells (apoptosis?) when in the presence of an overabundant amount of iron. It seems to leave the normal cells alone. You can see where this method would be more able to kill cancer in the fine interstices of the body that surgery or maybe directed radiation might miss. Happily, because of the Gates Foundation, we know the compound is safe for humans, and painless.

another word from our magnanimous sponsor..
The fact that millions of asians took artemisinin without side-effects long before Bill Gates made his first million doesn't seem to bother you..

Again, I suggest to all seekers here to research 'Artemisinin' and the 2 doctors that have been studying it; Drs. Henry Lai and Narendra

Re: Need advice on clinical trials

Singh at the University of Washington. This compound can be taken at the same time as many other treatments and not get in the way. I think there is only a problem with radiation therapy where you have to wait a while. Have
