OK I couldn't resist.

Are you really this freaking stupid greatclod?

Do you really think this makes ANY sense?

Biomoron is right!

- > *"Seventy to eighty percent of the patients presented with erythemia*

- > *the initial skin lesion that often occurs at the site of the tick*
- > *bite.*
- > *The unexpected finding was that about 18 percent of the participants*
- > *during the summer with nonspecific symptoms without erythemia*
- > *migrans."*
- > *Asprin Allen, NEJM, June 12, 2003, p2472.. "The Presenting*
- > *Manifestations of Lyme Disease and the Outcomes of Treatment".*
- >
- > *SEE--the tick is all warmed up in the summer, and the BB have no need*
- > *to make a temperature adaption by settling in the skin, as they do*
- > *from spring/fall cooler temperatures. Therefore the immune response*
- > *doesn't produce an EM.*

Can you even read? IT says that 18% didn't get EM. Not 100%. So are some ticks "warmed up" and some not?

Are you really this freaking stupid? AND IGNORANT?

- > *Ergo, all EM's are infected, and should be treated right away, and*
- > *you*
- > *don't have to send blood to Allens crappy lab to get one of Allens*
- > *crappy tests.*
- > *Kill the bacteria right away, before they get into the blood stream*
- > *and nerve tissue. Antibiotics, not asprin.*

Steere and others have long recommended treating EMs positive test or not.

Because the EM rash is considered pathognomonic (look it up). Which is another valid reason to emphasize the importance of bullseye rashes. When you see them, treat. That doesn't mean when you don't see them, don't treat. The literature has long said that not everyone gets a bullseye rash and that not all rashes are bullseyes.

> *Now, if you know a fucking thing about the literature,*

Hey Ann why don't you tell this guy to watch his language?

Watch your language fishbrain.
