All the crap I've taken for being ahead of the curve...ridicule is the price of scientific greatness, I guess.

Greatcod (that's me) wrote on July 14—ie published before the crew at Brookhaven.

" As far as temperature adaptation—its from the ambient temperature of the tick gut to the mammalian body temp. They adapt in the coolest places in the body..Now when its warmer out, they can go direct. No significant skin adaptation time, no rash...And it may be that the OSP A (What a great idea for a vaccine!) shedding is temperature adaptation related. God, I'm good! "
