Some scientist that spent half of his life researching spirochetes said that there are 1000 times more "DNA granules" with the ability to turn into spirochetes than actual spirochetes. I have seen pictures of them somewhere.

You remember which scientist?

And people like Lida Mattman, who \*did\* use dark field microscopy to prove that human blood is not sterile but contains all kinds of bacteria, got supeonaed and threatened with jail.

Yea, non-sterile blood and pathogens causing cancer, you can find info about that on "alternative" websites.

To the medical world blood is sterile and pleomorfism doesn't exist (no cysts, granules, L-forms).
