Obesity caused by a bacteria ?

Yes there is some logic behind this one. Some scientists have just found a possible connection to some virus, but the bacterial/parasite makes more logical sense.

The logic is simple, the bacterial/parasite drains nutrients from the digestive system, ie worms, and the person's biochemical system demands for more and more food.

The corruption also disables the proper digestion of food, so that even as one eats, they do not benefit from the food....and the fat builds up. In some cases important parts of the digestive system that break up fat are corrupted. This is all about corruption, internal corruption caused by 'secret unidentified elements'.

There are some simple, inexpensive treatments, that include a wide spectrum anti-parasitic herb, fiber to cleanse and probiotics to regenerate the healthy bacterial colonies that aid in digestion....

Here is a link to simple possible treatments....

By the way, a parasitic infection, often goes undetected with the result a variety of symptoms we call diseases, such as IBS, Crohn's, Cancer, MS, Schizophrenia, psychotic episodes, depression, anemia, etc, etc, etc....all based on the corruption of biochemical reactions within the body...
