John-boy's typically ancient sources are so obvious here. The hep C virus isn't just hypothetical -- it's even been sequenced. It's the same problem the HIV-deniers have: how to explain away a virus that not only exists, but that has been sequenced, and even put into phylogenetic trees.

These are my opinions only, but they're almost always correct.

"If I have not seen as far as others, it is because giants
were standing on my shoulders." (Hal Abelson, MIT)
