I'm even more excited about ActiveWords after spending the day playing with it.

DocQscribe users can rejoice! We now have a program that provides much-needed macro capability that is lacking in this otherwise-excellent transcription platform. After throwing together a bunch of commands to quickly access my favorite online references (such as the UPIN physician lookup and MedLexicon), I started working on some scripts to save my completed reports in my WinXP filing system. This provides a solution for MTs who wanted to use the filing system described on my forum but didn't like having to use the mouse.

DocQscribe users need to save completed reports in their own filing systems if they want access to them for longer than the 2 or 3 days that the reports are kept on the user's hard drive. I encourage DQS users to save nearly every report they create, both to make dictator-specific normals from them and to have the reports available for glossary compilation in Instant Text. If you use DocQscribe and this sounds interesting, I invite you to visit my productivity forum: <http://tripiforum.proboards28.com/index.cgi> [Note that DocQscribe is referred to as The Platform on that forum at the request of the trademark owner.] You'll find discussion of a filing system under Working with Windows; I've added a new board for ActiveWords discussions.
