Speech recognition is undergoing a paradigm shift. Earlier things were different. Just 5 years ago, now there are SR engines that create a draft of the dictation that gets better and better with time. They call it neural technology. Comments anyone? And since I want to discuss, I'd rather request you guys to talk a bit more elaborately.

Hi:

How long do you think MT is going to survive? Dont you think considering the recent developments in EMR and speech recognition, it wont exist in a couple of years?
