Jeannie,

I have no idea why this isn't working for you on the XP computer, but I'll bet a jillion dollars that Cheryl knows! Usually when we call out her name she appears...

Sandi,

I've also done it many times with traveling to different computers, and you don't need a macro. There are instructions in Cheryl's book, and as I said, I've done it a lot. You just have to make sure that the .acl files are named the same (and that you transfer the correct .acl file, since they can be several).

Like I said, though, the instructions in her book don't cover 2003 (at least not in my book) and the Win XP Professional has different folder names and when I try to copy the \*.acl and the normal.dot and the dictionary file over from a folder of one name on the previous computer to overwrite the one in a different file name on the other computer, it doesn't work. I successfully moved it to my laptop and to my Windows 2000 Professional computer but not on my Windows XP professional computer, which is where I need it. I have used her book faithfully and successfully for many years.
