Wireless routers don't always do that well. I am VERY limited in how far I can take my laptop, and I bought an expensive booster to add to my wireless router. I now can take the router to the porch, but not out by the pool, and my son had to hardwire his connection in his home which is just a few feet from ours. If there is not a lot of distance involved a wireless routed is fine.

Use wireless routers.

"Bam" <dearcounselor@xxxxxxxxxxxxxx> wrote in message news:5g46ohF3feo0bU1@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

I currently have a 4-port Linksys Wireless-B router.

However, I need to know how to grow beyond that.

Currently, during the day I'm on 2, sometimes 3, computers simultaneously.

My daughter is working from home right now too-

And my phone is VoIP.

If there are 3+ computers going, the phone doesn't work.

So do I buy a bigger router? (Is there such a thing?)

I was happy that I figured out how to network the house using THIS one!

HELP! This is creating a HUGE issue for me and I need to fix it today if I can!!
