The Olympus DS-2300 has a dedicated button you have to push to create a new file, unlike the DS-2 which automatically creates a new file every time you push the Stop button. It has the removeable media and it also allows you to edit files on the recorder, i.e., rewind and listen to something you've dictated and then overwrite or insert, etc. The one thing it doesn't have is a docking station, you can either plug it in directly to the PC with a USB cable or use a media card reader.

Ok, one of the people I transcribe (guess who) is unable to consistently use our Sanyo digital recorders without breaking a single dictation into multiple files, creating new folders instead of new files, etc., etc.

I need a recommendation for a SIMPLE digital recorder. It needs to have a removable memory card (preferably an SD card, but other cards would be OK), and it needs to record in a file format compatible with Express Scribe.

Any help would be appreciated.
