Who knows, who cares.

Remember this issue is not about circ'ing the world but rather that male circumcision is a perfectly acceptable parental decision as a result of religious, cultural or medical considerations.

Talking about Europe. Let us talk about cervical cancer.

The skin freaks have long been selling the lie that cervical cancer is not a problem in traditionally non–circumcising communities in Europe.

Now the first rule when dealing with skin freaks is that whenever they say something often, stridently and loudly you need to know that with a little scratching on the surface you will discover a can of worms.

Look at this study.

The cervical cancer epidemic that screening has prevented in the UK.
<http://tinyurl.com/6x8e4>

It states quite clearly that: "Cervical screening has prevented an epidemic that would have killed about one in 65 of all British women born since 1950..."

So what has prevented an epidemic of cervical cancer has been cervical screening and the subsequent cervical cancer rates are an indication of the success of such screening rather than providing proof that circumcision does not contribute to a reduction in cervical cancer.

So where does this all lead us?

It reconfirms that anything and everything stated by the skin freaks must be viewed with a very wary eye as a little scratching on the surface will expose a can of worms.
