BEIJING, China (AP) -- China has reported the fourth bird flu outbreak in a northeastern province in the past two weeks amid fears that counterfeit flu vaccines being sold there might be worsening the public health threat.

The report on Friday brought the total number of outbreaks reported by China in the latest round of cases to seven.

Ok so the question is...if there were 2 cases would that constitute an "outbreak" what exactly (in numbers) constitutes an outbreak?

.
