Hi,

I am a 34 year old. I sometimes get high fevers that last a day. By the next day they are gone. During these fevers I have flu like symptoms. (Aches chills, etc) The symptoms last a few hours. The fever stays all day but is gone by the next day. This seems to happen every three months or so.

Last year I asked to be referred to an infectious disease doctor. She said because of my age they were worried about lymphoma. I had a gallium scan that showed everything normal except a spot near my diaphragm with "significant gallium uptake". I had a follow up chest ct scan that showed everything normal. She said not to worry about it. I had repeated blood tests about 4 times. I had no histoplasmosis. When I first got sick my c-reactive protein was high. but it went back to normal. I decided not to worry about it.

I had sinus problems for three weeks last month and went to the doctor. Was put on zithromax. Finished it and sinus problems went away. A week later woke up with a low grade fever. (99-100) Had chills and everything like before. Went to the doctor and he put me on Septra. Fever automatically was gone next day as countless times last year around this time. Two weeks later (which was yesterday) Started having chills at work and feeling terrible. Went to the doctor and temp was 102.6. Put me on tamaflu. (Even though I had the flumist vaccine). This morning temp is 97.8 and no symptoms.

I know you can't diagnose over the internet but I live in a small town and am wondering if there are tests I should be asking for? Someone I work with has mono. I have had it before and the doctor told me yesterday it was hard to get mono twice. She had a LDH test or something that tests for lymphoma but I have never had that. Should I ask for it?

Everyone at work notices I get sick a lot. Are there tests I can ask for to determine why? I have had the basic cbc, metabolic profile, Epstein-Barr, c reactive protein, cytomegalovirus, HIV, Rocky Mountain Spotted

Weird fevers

fever, histoplasmosis last year. But it has been a year since those tests.

I really appreciate any direction you can point me to.
