I had another blood test last week. The reference ranges for urine sodium  
urine potassium  
urine chloride  
were not listed on the blood test results. Please check the PDR or any of your other reference books and post the standard reference ranges for the three urine electrolytes mentioned above.

Also, please comment on these results:

serum sodium 140 (135-145)  
serum potassium 3.7 (3.5-5.1)  
serum chloride 103 (98-107)

urine sodium 20 (reference range--not listed)  
urine potassium 25.3 (reference range--not listed)  
urine chloride 26 (reference range--not listed)

The urine test was NOT a 24 hour urine test--it was a spot test.

I done a google search but was not able to find the reference ranges for urine sodium, urine potassium or urine chloride.

My doctor told me that I have hypothyroidism. The TSH level on my last blood test was 7.56 (reference range 0.27-4.2). The Free T4 on that same blood test was 0.98 (reference range 0.9-1.7).

Differential  
eosinophils 6.5 (reference range 0-4)

Thanks in advance,  
Jason
